Turing Machine

2 components: I/P tape, finite state logic

- The i/p tape now is a bidirectional element having a read/write head such that the m/c can decide to make an R/L movement or R/W operation at the given location.
- The tape can now contain multiple strings/sentences simultaneously each being separated by at least one blank symbol "δ" or "␣".
- Initially the entire tape is considered to have only blank elements. The tape has a left end beyond which the head cannot move. However, the tape can logically be extended to ∞ on the right.
- If not explicitly provided an R/L movement, the head will stay at its location even after a R/W operation.

→ Decidability
→ Special func.
→ Numerical operations
